

Description

The PAC-ZC Zone controller is used in conjunction with Mitsubishi Electric ducted units and will allow open/close operation of motorised dampers.

Functions

- 4 and 8 zone options are available with 24V AC/230V AC damper output options.
- This controller allows monitoring and operation of the ducted unit and also individual zones.
- It is equipped with three built-in sensors (temperature, brightness & occupancy) which allows for comfortable air environment and also helps to reduce energy consumption.

Notes

- Zone Controller allows for the connection of 2 additional temperature sensors for better control of the unit by averaging of the sensors values.
- This then allows automatic fan speed control depending on the number of open outlets and the difference between the set temperature and space temperature.
- Zone Controller also has an option to connect optional Wi-Fi interface (MAC-568IF-E) that allows to control ducted unit and individual zones from virtually anywhere via smart phone, tablet or PC.

Applicable models

All P series ducted indoor units.
